

Testing Report

One major issue I found at first was regarding displaying the correct number of song audio players. While most songs only had one audio cut, some had two, so I thought that by having each page display two, it would solve the issue, as for the songs with only one cut, the second audio path was given a null value. However, the result was that the songs with only one cut would show another audio player, which wasn't usable. I wanted to get rid of that second audio player and make sure that it only showed up for songs that had two audio cuts. To resolve this, I added an if-then statement in my script to add an audio player for the secondary audio cut if it existed (wasn't null) under the dropdown event listener, and then added the element for that specifically just under the first set of song info in the index HTML file. I also had some trouble porting the files to a GitHub page (which I now realize I probably could have saved a lot of time and effort on). I initially tried to clear out my GitHub page repository and copy my current files to that, but it didn't seem to work at first. I probably should have waited a bit longer to see if it would work, but after several attempts of re-adding and re-deleting files and repositories, I found a method to resolve this, which was to just clone the current repository I had and set that as my GitHub page repository. This way, I wouldn't have to deal with the headache of figuring out how to upload >25mb files to GitHub, since the web browser version doesn't let you do that. I also deleted all the files I wasn't using for this version of the project, since they would have made it exceed 1 GB and also just created clutter for the time being. One last issue I encountered was that whenever switching between songs, I noticed that the English title (for song titles in Japanese) would show up when going from one song with an English translated title to one without one. To resolve this, I just added an else statement that would ensure it only showed up if it didn't have a null value. I did the same for the audio, since it also had the same issue when switching between songs with one and two audio cuts.
